Web Interface Design - Sheet #11 –Form Development

JavaJam Coffee House (exercise derived and modified from Felke text)

Add another page to the JavaJam web site as per the instructions below. Use the same layout as the rest of the site except make these new Jobs page in 2-column layout. No ads should appear on these pages. Update your CSS as needed.

Jobs Page: (see below) Include input areas for the applicant's name, email, telephone number, position being applied for, and availability. Use HTML5 elements for these input areas in order to have as many elements self-validate as possible. Determine for yourself what positions are currently available and make them accessible to the applicant when they fill in the form. Make sure the applicant enters their name and email.

Validate your pages again. Check that all the pages link to the new page. Display the site in all the browsers in the lab to assure that you have achieved stability.   Get your page checked off.
